

HM62256B Series

32,768-word × 8-bit High Speed CMOS Static RAM

The Hitachi HM62256B is a CMOS static RAM organized 32-kword × 8-bit. It realizes higher performance and low power consumption by employing 0.8 μm Hi-CMOS process technology.

The device, packaged in 8 × 14 mm TSOP, 8 × 13.4 mm TSOP with thickness of 1.2 mm, 450-mil SOP (foot print pitch width), 600-mil plastic DIP, or 300-mil plastic DIP, is available for high density mounting. It offers low power standby power dissipation; therefore, it is suitable for battery back-up systems.

Features

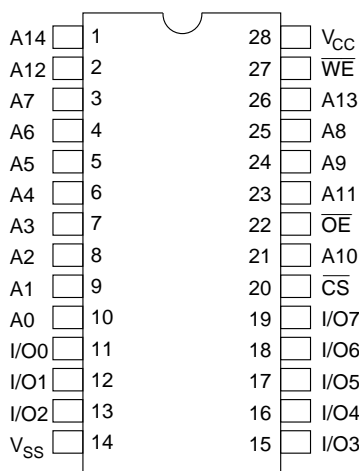

- High speed
Fast access time: 70/85/100/120 ns (max)
- Low power
Standby: 1.5 μW (typ)
Operation: 25 mW (typ) (f = 1 MHz)
- Single 5 V supply
- Completely static memory
No clock or timing strobe required
- Equal access and cycle times
- Common data input and output
Three state output
- Directly TTL compatible
All inputs and outputs
- Capability of battery back up operation

Write Timing Waveform (1) (\overline{OE} Clock)

Write Timing Waveform (2) (\overline{OE} Low Fixed)*12

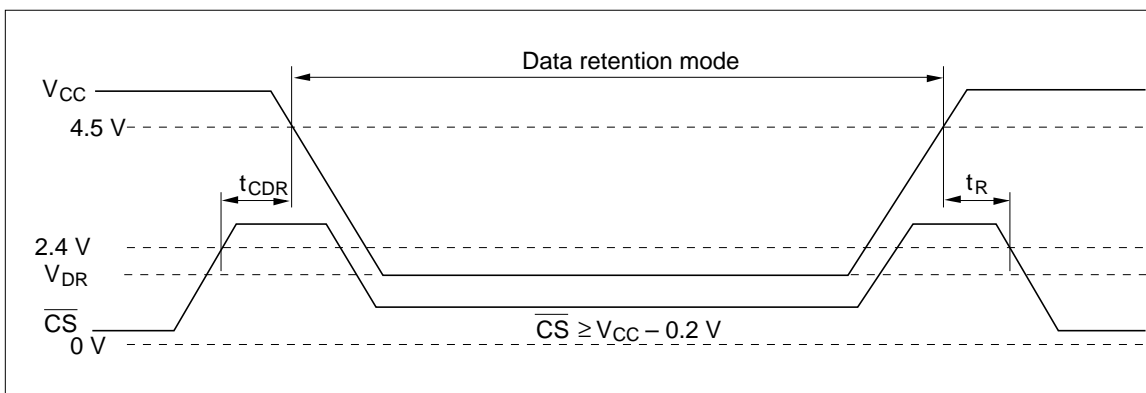

- Notes:
1. A write occurs during the overlap(t_{WP}) of a low \overline{CS} and a low \overline{WE} . A write begins at the later transition of \overline{CS} going low or \overline{WE} going low. A write ends at the earlier transition of \overline{CS} going high or \overline{WE} going high. t_{WP} is measured from the beginning of write to the end of write.
 2. t_{CW} is measured from \overline{CS} going low to the end of write.
 3. t_{AS} is measured from the address valid to the beginning of write.
 4. t_{WR} is measured from the earlier of \overline{WE} or \overline{CS} going high to the end of write cycle.
 5. During this period, I/O pins are in the output state so that the input signals of the opposite phase to the outputs must not be applied.
 6. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transition or after the \overline{WE} transition, the outputs remain in a high impedance state.
 7. Dout is the same phase of the write data of this write cycle.
 8. Dout is the read data of next address.
 9. If \overline{CS} is low during this period, I/O pins are in the output state. Therefore, the input signals of the opposite phase to the output must not be applied to them.
 10. This parameter is sampled and not 100% tested.
 11. t_{OHZ} and t_{WHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.
 12. In the write cycle with \overline{OE} low fixed, t_{WP} must satisfy the following equation to avoid a problem of data bus contention, $t_{WP} \geq t_{WHZ} \max + t_{DW} \min$.

Low V_{CC} Data Retention Characteristics ($T_a = 0$ to $+70^\circ\text{C}$)

Parameter	Symbol	Min	Typ ^{*1}	Max	Unit	Test conditions
V_{CC} for data retention	V_{DR}	2.0	—	5.5	V	$\overline{CS} \geq V_{CC} - 0.2\text{ V}$, $V_{in} \geq 0\text{ V}^{*5}$

Low V_{CC} Data Retention Timing Waveform

- Notes:
1. Typical values are at $V_{CC} = 3.0\text{ V}$, $T_a = 25^\circ\text{C}$ and not guaranteed.
 2. $10\ \mu\text{A}$ max at $T_a = 0$ to $+40^\circ\text{C}$.
 3. $3\ \mu\text{A}$ max at $T_a = 0$ to $+40^\circ\text{C}$. (only for L-SL version)
 4. t_{RC} = read cycle time.
 5. \overline{CS} controls address buffer, \overline{WE} buffer, \overline{OE} buffer, and D_{in} buffer. If \overline{CS} controls data retention mode, V_{in} levels (address, \overline{WE} , \overline{OE} , I/O) can be in the high impedance state.
